AL IGNMENTS

```
The present invention provides alpha-1,3/4-fucosyltransferase (also termed as fucosyltransferase) proteins and nucleic acids from various strains of Helicobacter pylori. This enzyme catalyzes the transfer of a fucose residue from a donor substrate to an acceptor substrate. The fucosyltransferase polynucleotides and polypeptides are useful for the synthesis of oligosaccharides, glycoproteins and glycolipids. The present sequence is Helicobacter pylori fucosyltransferase protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated fucosyltransferase polynucleotides and polypeptides, useful for synthesizing oligosaccharides, glycoproteins, or glycolipids.
                                                                                                    Helicobacter pylori fucosyl transferase, FutA, protein, SEQ ID NO: 20.
                                                                                                                                                                                                                                                                                                                                                                          Bezila DJ;

This is the amino acid sequence of the novel alpha-1,3-
fucosyltransferase of Helicobacter pylori NGTC 11639, as deduced from the
newly isolated fucT gene (see AAV80321). The enzyme is characterised by 8
c-terminal heptad repeats and by the lack of a transmembrane domain. The
absence of a transmembrane domain allows the enzyme to be readily
released from recombinant host cells. The enzyme can be used in the
production of fucosylated oligosaccharides such as Lewis X, Lewis Y and
sialyl Lewis X, which are structurally similar to certain tumour
associated antigens found in mammals. These glycoconjugates also have
research and diagnosis utility in the development of assays to detect
mammalian tumours. The enzyme can also be used to raise specific
antibodies. Inhibition of abnormal fucT gene product activity can be used
for the treatment of intestinal mucosal disease. (Updated on 17-OCT-2003
to standardise OS field)

```

fucosyltransferase gene product activity. The nucleic acid is useful as part of ribozyme and/or triple helix sequences and for alphal, 3-fucosyltransferase gene regulation. Oligosaccharides synthesised using the protein or cell are useful in the development of assays to detect mammalian tumours. The present sequence represents an H. pylori alphal, 3 fucosyltransferase encdoed by the fucT gene. (Updated on 29-AUG-2003 to standardise OS field)

Sequence 476 AA;

888888888888

The invention relates a purified transmembrane segment-free alpha 1,3fucosyltransferase polypeptide, having a repeat of the sequence: X_1-X_2Leu-Argy (3-X 4-Tyr, where X 1, X 2 and X 4 is a Asp or Asn; and X 3 is

[10, Val or Ala. Also included are the mucleic acid encoding the protein

(including its complement or fragment), a vector containing the nucleic

acid, a host cell containing nucleic acid or vector, an antibody which

selectively binds to the protein and a gene expression system for

comprising a host cell modified with the nucleic acid or its

comprising a host cell modified with the nucleic acid or its

comprising the protein with a substrate such as LackAc-R and GDP-fucose,

contacting the protein with a substrate, to produce oligosaccharides

and purifying the protein with a substrate, to produce oligosaccharides

contacting the host cell with a substrate, to produce oligosaccharides

and purifying the obtained oligosaccharides. The nucleic acid is useful

contacting the notein with a substrate, to produce oligosaccharides

and purifying the nucleic acid using polymerase colid, by contacting a sample with a

cucleic acid probe that hybridisation of the probe; or by

polynucleotide, and detecting hybridisation of the probe; or by

corporably linked to a polynucleotide encoding a dearted polypeptide

cor peptide under conditions which allow expression and secretion of the

cusplicative of infection by Helicobacter pylori or the presence

con malignant cells. The antibody is also useful for diagnasing disorders

con malignant cells. The antibody is also useful for diagnasing disorders

and monitoring disease, and for inhibiting abnormal alphal,3-

Futh and FutB) of Helicobacter pylori (H. pylori). Specifically, it refers to alpha 1-3/4 fucosyltransferase enzymes (FutA and FutB) of Helicobacter pylori (H. pylori). Specifically, it refers to alpha 1-3/4 fucosyltransferase enzymes that can be used to chemically synthesise glycoproteins and glycollpids with the desired oligosaccharide moieties (i.e. by transfer of a fucose residue to N-acetyfglucosamine), such that they are useful in the preparation of glycoconjugates. The present invention describes how bacterial of fucosyltransferase is unaffected by the sialyation status of the acceptor sugar, as opposed to the mammalian homologue, and furthermore, bacterially expressed enzymes offer a large cost saving relative to strain 1218 FutB protein sequence of the invention.

This invention relates to novel isolated polynucleotides and the encoded

Claim 16; SEQ ID NO 6; 72pp; English

New isolated polynucleotide encoding fucosyltransferase protein, usefu for synthesizing oligosaccharide moiety on a protein or lipid that is unglycosylated in its native form or for synthesizing glycolipids.

The present invention provides alpha-1,3/4-fucosyltransferase (also termed as fucosyltransferase) proteins and nucleic acids from various strains of Helicobacter pylori. This enzyme catalyzes the transfer of a fucose residue from a donor substrate to an acceptor substrate. The fucosyltransferase polymucleotides and polypeptides are useful for the synthesis of oligosaccharides, glycoproteins and glycolipids. The present sequence is Helicobacter pylori fucosyltransferase protein.

The method involves contacting a recombinant fucosyltransferase protein with a mixture comprising a donor substrate which comprises a fucosyl residue, and an acceptor substrate on a sylycoprotein, under conditions such that the fucosyltransferase protein catalyzes the transfer of the fucose residue from a donor substrate to the acceptor substrate on the glycoprotein. The method is useful for producing fucosylated glycoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MFQPLLDAYIESASIEKITSKSPPPLKIAVANWW--GDEEVEEFKKNILYFILSQHYTIT 58

chemically synthesise glycoproteins and glycolipids with the desired oligosaccharide moieties (i.e. by transfer of a fucose residue to Nactification of actylglucosamine), such that they are useful in the preparation of glycoconjugates. The present invention describes how bacterial fucosyltransferase is unaffected by the sialyation status of the acceptor sugar, as opposed to the mammalian homologue, and furthermore, bacterially expressed enzymes offer a large cost saving relative to strain 1182 FutB protein sequence of the invention.

                                                                                                                                                                            This sequence represents an alpha-1,3/4-fucosyltransferase protein which was used in the method of the invention for producing a fucosylated glycoprotein. The method involves contacting a recombinant fucosyltransferase protein with a mixture comprising a donor substrate which comprises a fucosyl residue, and an acceptor substrate on a glycoprotein, under conditions such that the fucosyltransferase protein catalyzes the transfer of the fucose residue from a donor substrate to the acceptor substrate to

This enzyme catalyzes the transfer of a fucose readiue from a donor substrate to an acceptor substrate. The fucosyltransferase polymucleotides and polypeptides are useful for the synthesis of oligosaccharides, glycoproteins and glycolipids. The present sequence is Helicobacter pylori fucosyltransferase protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  118

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates a purified transmembrane segment-free alpha 1,3-
fucosyltransferase polypeptide, having a repeat of the sequence: X_1-X_2-
fucosyltransferase polypeptide, having a repeat of the sequence: X_1-X_2-
CC fucosyltransferase polypeptide, having a repeat of the sequence: X_1-X_2-
CC leu-Argy, where X 1, X 2 and X 4 is a spo or Asn; and X 3 is
CLO Also included are the nucleic acid encoding the protein
(including its complement or fragment), a vector containing the nucleic
acid, a host cell containing nucleic acid or vector, an antibody which
selectively binds to the protein and a gene expression system for
producing transmembrane segment-free alphal, 3- fucosyltransferase,
comprising a host cell modified with the nucleic acid or its
enzymatically active portion. The protein and cells are useful for
producing fucosylated oligosaccharides, uch as LackAc-R and GDP-fucose,
contacting the protein with a substrate such as LackAc-R and GDP-fucose,
and purifying the protein with a substrate, to produce oligosaccharides
and purifying the obtained oligosaccharides. The nucleic acid is useful
as a probe for detecting the nucleic acid, by contacting a sample with a
cucleic acid probe that hybridises to alphal, 3-fucosyltransferase
colynucleotide, and detecting hybridisation of the probe; or by
fucosyltransferase-fusion protein, by growing the host cell containing a
cor operably linked to a polynucleotide encoding a desired polypace
cor peptide under conditions which allow expression and secretion of the
fusion protein and isolating the fusion protein. The antibody is useful
cor peptide under conditions which allow expression and detecting the protein in a sample. The presence of the protein in the
sample is indicative of infection by Hellcobacter pylori or the presence
of malignant cells. The antibody is also useful for diagnosing disorders
and monitoring disease, and for inhibiting abnormal alphal,3-

fucosyltransferase gene product activity. The nucleic acid is useful as part of ribozyme and/or triple helix sequences and for alphal, 3-fucosyltransferase gene regulation. Oligosaccharides synthesised using the protein or cell are useful in the development of assays to detect mammalian tumours. The present sequence represents an H. pylori alphal, 3 fucosyltransferase encooled by the fucT gene. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                 58
                                                                                                                                                                                                                                                                                                                                                       58

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (UYAL-) UNIV ALBERTA.
```

g

```
The invention relates a purified transmembrane segment-free alpha 1,3-
C fucosyltransferase polypeptide, having a repeat of the sequence: X 1-X 2-
Leu-Arg-X 3-X 4-Tyr, where X 1, X 2 and X 4 is App or Abn; and X 3 is
Leu-Arg-X 3-X 4 or Ala. Also included are the nucleic acid encoding the protein
C (including its complement or fragment), a vector containing the nucleic
acid, a host cell containing nucleic acid or vector, an antibody which
selectively binds to the protein and a gene expression system for
comprising transmembrane segment-free alphal, 3- fucosyltransferase,
comprising a host cell modified with the nucleic acid or its
comprising a host cell with a substrate such as lackno-R and GDF-fucose,
compacting the protein with a substrate, to produce oligosaccharides
con purifying the protein with a substrate, to produce oligosaccharides
contacting the bost cell with a substrate, to produce oligosaccharides
contacting the bost cell with a substrate, to produce oligosaccharides
contacting the bost cell with a substrate, to produce oligosaccharides
contacting the bost cell with a substrate, to produce oligosaccharides
contacting the bost cell with a substrate, to produce oligosaccharides
contacting the moteleic acid, by contacting a sample with a
nucleic acid probe that hybridises to alphal,3-tucosyltransferase
contacting the nucleic acid using polymerase chain reaction (PCR). The
nucleic acid probe that hybridises to alphal,3-tucosyltransferase
contacting the mucleic acid using polymerase chain reaction (PCR)
amplifying the nucleic acid using polymerase chain reaction (PCR). The
copying transferase-fusion protein, by growing the host cell containing a
cvector operably linked to a polyunclectide encoding a desired polypeptide
cor peptide under conditions which allow expression and secretion of tusion protein and sellaring the fusion protein.
C or detecting the protein in a sample. The presence of the protein or cell ace useful in the development of capacial is useful and monitoring disease gene regulation. Olig
                                                                                                  Purified transmembrane segment-free alphal, 3-fucosyltransferase polypeptide useful for producing fucosylated oligosaccharides.
                                                                                                                                                                               Claim 6; Fig 6; 37pp; English.
                                                 WPI; 2002-582480/62.

Pulsa invalidation interpolation of the fucosyltransferase enzymes (FutA and FutB) of Helicobacter pylori (H. pylori). Specifically, it refers to alpha 1-3/4 fucosyltransferase enzymes that can be used to chemically synthesise glycoproteins and glycolipids with the desired oligosaccharide moieties (i.e. by transfer of a fucose residue to N-acetyglucosamine), such that they are useful in the preparation of glycoconjugates. The present invention describes how bacterial fucosyltransferase is unaffected by the sialyation status of the acceptor sugar, as opposed to the mammalian homologue, and furthermore, bacterially expressed enzymes offer a large cost saving relative to armamalian expression systems. This polypoptide sequence is an H. pylori etrain 1111 FutA protein sequence of the invention. 299 THPNAYLDMLYENPLNTLDGKAYFYQNLSFKKILDFFKTILENDTIYHDNPFIF---YRD 355 454 435 This invention relates to novel isolated polynucleotides and the encoded New isolated polynucleotide encoding fucosyltransferase protein, usefu for synthesizing oligosaccharide moiety on a protein or lipid that is unglycosylated in its native form or for synthesizing glycolipids. 412 ------DHDDLRRDHERLLSKATPLLELSQNTSFKIYRKAYQKSLPLLR Futh, Futh; alpha 1-3/4 fucosyltransferase; glycoprotein; glycolipid; fucose; N-acetylglucosamine; glycoconjugate; enzyme. Gaps

which comprises a fucosyl residue, and an acceptor substrate on a glycoprotein, under conditions such that the fucosyltransferase protein eatalyzes the transfer of the fucose residue from a donor substrate to the acceptor substrate on the glycoprotein. The method is useful for producing fucosylated glycoprotein.

```

This sequence represents an alpha-1,3/4-fucosyltransferase protein which was used in the method of the invention for producing a fucosylated glycoprotein. The method involves contacting a recombinant fucosyltransferase protein with a mixture comprising a donor substrate

B71914
alpha (1,3)-fucosyltransferase - Helicobacter pylori (strain 199)
C;Species: Helicobacter pylori
A;Variety: strain J99
C;Date: 12-Feb-1999 #sequence revision 12-Feb-1999 #text change 09-Jul-2004
C, Accession: B71914
R;Alm, R.A.; Ling, L.S.L.; Moir, D.T.; King, B.L.; Brown, B.D.; Doig, P.C.; Smith, D.R.;
; Ives, C.; Gibson, R.; Merberg, D.; Mills, S.D.; Jiang, Q.; Taylor, D.E.; Vovis, G.F.; 7
Nature 397, 176-180, 1999
A, Title: Genomic sequence comparison of two unrelated isolates of the human gastric path
A; Reference number: A71800; MUID:99120557; PMID:9923682
A;Accession: B71914
A;Status: preliminary
A; Molecule type: DNA
A;Residues: 1-454 <arn></arn>
A;Cross-references: UNIPROT:Q9ZLI3; UNIPARC:UPI00000D3665; GB:AE001491; GB:AE001439; NID:
